What is Multiple Sclerosis? Multiple sclerosis is an inflammatory disease that causes a person's immune system to attack their body's central nervous system. Unfortunately, this can directly affect a person's brain and spinal cord. Symptoms will differ between everyone, but issues often arise with a person's cognition and memory, their physical abilities, and even their emotional state. Unfortunately, a person's life expectancy once MS sets in is only 30 years. Sodium Intake by the Numbers For people who believe that they don't have too much salt in their diet, it's a good idea to actually verify this belief. The American Heart Association recommends a maximum of 1,500 milligrams of salt per day, but studies have shown that the average American greatly exceeds this level by consuming around 3,400 milligrams a day. In fact, the Centers for Disease Control (CDC) have stated that 9 out of every 10 people in America eat more salt than is healthy.
